

STARTUP INVESTMENT ANALYSIS

Using Shark Tank India Dataset

Submitted by: Isha Mukherjee

ABSTRACT

This project presents a data analysis and visualization of Shark Tank India startup investment data. The dataset was analyzed to understand startup distribution across industries, investment amounts, investor participation, top-funded startups, and deal acceptance patterns. Power BI was used to create an interactive dashboard containing key performance indicators, charts, and an industry filter. The analysis helps identify investment patterns across different industries and provides a visual understanding of investor participation and accepted deals.

1. INTRODUCTION

Shark Tank India provides a useful dataset for studying startup investment patterns. The dataset contains information about startups, industries, deal amounts, investor participation, and deal acceptance. By organizing and visualizing this information, meaningful patterns can be identified more easily.

The purpose of this project is to analyze startup investment trends and present the results through an interactive Power BI dashboard. The dashboard provides an overview of the number of startups, total investment, average investment, industry-wise investment, top startups by investment, and investment according to the number of participating sharks.

2. OBJECTIVE

- To analyze startup investment trends using Shark Tank India data.
- To study investment distribution across different industries.
- To analyze the number of startups in different industries.
- To identify the top startups based on investment amount.
- To analyze investment according to the number of participating sharks.
- To study industry-wise investor investment trends.
- To analyze accepted deal patterns.
- To create an interactive dashboard for visual data analysis.

3. DATASET

The project uses a Shark Tank India startup dataset containing information related to startups, industries, deal amounts, investor investments, and accepted offers. The dataset was imported into Power BI and used for creating different visualizations and analyses.

4. TOOLS USED

Microsoft Power BI

Used for:

- Data visualization
- Dashboard creation
- KPI cards
- Charts
- Filters/slicers
- Data analysis

Microsoft Excel/CSV

5. METHODOLOGY

➤ Step 1 — Data Collection

The Shark Tank India dataset was obtained in CSV format.

➤ Step 2 — Data Import

The dataset was imported into Microsoft Power BI.

➤ Step 3 — Data Organization

Relevant fields such as startup name, industry, deal amount, investor investment amounts, number of sharks, and accepted offer were used for analysis.

➤ Step 4 — KPI Creation

The following key metrics were created:

- Total Startups
- Total Investment
- Average Investment

➤ Step 5 — Visualization

Different charts were created to analyze:

- Industry-wise investment
- Number of startups by industry
- Top 10 startups by investment
- Investment by number of sharks
- Industry-wise investor investment

STARTUP INVESTMENT ANALYSIS

➤ Step 6 — Interactive Filtering

An **Industry** slicer was added so users can filter the dashboard according to industry.

➤ Step 7 — Deal Analysis

Accepted deals were analyzed by industry and through an acceptance-status donut chart.

7. KEY FINDINGS

Metric	Result
--------	--------

STARTUP INVESTMENT ANALYSIS

Using Shark Tank India Dataset

Submitted by: Isha Mukherjee

Total Startups	789
Total Investment	34.82K
Average Investment	34.82K

The dashboard provides an overall view of startup investment activity. It includes industry-wise investment distribution, startup counts, top startups based on investment, and investment distribution according to the number of sharks.

▪ Industry Analysis

The industry analysis shows that startup activity and investment are distributed unevenly across industries. The dashboard allows comparison of both the number of startups and the total deal amount for different industries.

▪ INDUSTRY-WISE INVESTOR TRENDS

The investor analysis visualizes the investment amounts contributed by different sharks across industries. The stacked chart allows comparison of investor participation within each industry and provides an overview of how investment contributions are distributed.

▪ DEAL SUCCESS ANALYSIS

The deal acceptance analysis examines accepted offers across different industries. The acceptance-status visualization shows 434 accepted offers and 68 non-accepted offers among the 502 records represented in the visualization. This provides a simple view of deal acceptance patterns in the available dataset.

Dataset Limitation: Founder-level success analysis could not be performed because founder-specific information was not available in the provided dataset

8.CONCLUSION

The Startup Investment Analysis project demonstrates how business data can be transformed into meaningful visual insights using Power BI. The dashboard provides an overview of startup counts, investment amounts, industry-wise trends, top startups, investor participation, and deal acceptance patterns. Interactive filtering makes it easier to explore the dataset from different industry perspectives.

The analysis also demonstrates the importance of data visualization in understanding large datasets and identifying investment patterns. Although founder-specific information was not available in the dataset, the available startup, investor, industry, and deal information was successfully analyzed through the dashboard.
